5.1. Test Case <N>	9

1. Introduction (10%)

<< This section gives introductory information regarding the project, the system to be tested, and the testing approach. >>

1.1. Purpose

<< Identify the project and stipulate the test plan purpose by indicating what the document contains (e.g., organizational responsibilities, test approach, test schedule—tell the audience what you are going to tell them. >>

1.2. Scope

<< Specify the project product releases/versions encompassed by the plan. >>

1.3. System Overview

<< Describe the system to be exercised by the testing approach specified in the plan. This overview serves to identify aspects of the system operation that will be the focus of the plan's testing approach. This section should give a conceptual diagram showing how the system operates, including its external interfaces. >>

1.4. Testing Approach Overview

<< Give an overview of the approach specified in Section 2. This overview is intended for those who do have the time to read the detailed report on testing. For example, if Section 2 gives a multilevel approach to testing, this section would briefly indicate the objective and scope of each of the test levels. This overview should be linked to the conceptual diagram given in Section 1.3. System testing activities will include the testing of new functionalities, modified functionalities, screen level validations, workflows, functionality access, testing of internal & external interfaces.>>

1.5. Testing Entrance Criteria

<< To start system testing, certain requirements must be met for testing readiness. >>

1.6. Document Overview

1.7. References

<Enter project name> System Test Plan

<< List all the references applicable to the test plan. Generally, this includes project standards, software specification documents (such as requirements, design, database specifications). It could also include a product assurance plan that establishes the context for project testing. >>

2. Testing Approach (20%)

<< Describe the approach to be used to test the system. This description includes specifying the types of tests to be performed, e.g., tests designed to exercise system functions one by one; tests designed to exercise sequences of functions that approximate operational use of the system; tests designed to stress the system to its design and requirements limits. The description lists the specific tests to be performed but does not give the test steps. For each of these tests, give it a name and specify its objective. Describe how the test procedures for these tests are to be specified and describe how the test incidents are to be reported.

Other sections that may appear in a test plan (but not necessarily required) are as follows:

- Test Management Requirements: how testing is to be managed; a delineation of responsibilities of each project organization involved with testing*
- Personnel Requirements: delineate the responsibilities of those individuals who are to perform the testing.*
- Hardware Requirements: describe the hardware (including communication and network equipment) needed to support testing; describe configuration of hardware components on which software and database to be tested are to operate.*
- Software Requirements: describe the software needed to support testing; include the software code and databases that are object of the testing. Also include software tools such as compilers, instruments, and simulators that are needed to model the user's operational environment.*
- Cost: include an estimate of costs. >>*

2.1. Testing Types

<< These headings are just examples, and these should be customized as needed for the project >>

2.1.1. Usability Testing

<< User interface attributes, cosmetic presentation and content will be tested for accuracy and general usability. The goal of Usability Testing is to ensure that the User Interface is comfortable to use and provides the user with consistent and appropriate access and navigation through the functions of the application (e.g., access keys, consistent tab order, readable fonts etc.) >>

2.1.2. Functionality Testing

<< The objective of this test is to ensure that each element of the component meets the functional requirements of the business as outlined in the:

- Business / Functional Requirements*
- Business rules or conditions*
- Other functional documents produced during the course of the project i.e. resolution to issues/change requests/feedback >>*

2.2. Testing Suspension Criteria and Resumption Requirements

This section will specify the criteria that will be used to suspend all or a portion of the testing activities on the items associated with this test plan.

2.2.1. Suspension Criteria

Testing will be suspended if the incidents found will not allow further testing of the system/application under-test. If testing is halted, and changes are made to the hardware, software, or database, it is up to the Testing Manager to determine whether the test plan will be re-executed, or part of the plan will be re-executed.

2.2.2. Resumption Requirements

<< Resumption of testing will be possible when the functionality that caused the suspension of testing has been retested successfully. >>

2.3. Testing Environment

<< Describe the testing environment that this test plan and the following test cases will be executed in. >>

2.4. Testing Assumptions

<< Possible assumptions made during the planning, design, or execution of this test plan. >>

2.5. Testing Risks and Contingencies

<< Possible risks and the corresponding contingencies designed to mitigate or nullify the event resulting from the risk >>

2.6. Test Plan

<< The test plan will be designed to accommodate some changes, if necessary, such as if testing is incomplete on any day. All the test cases of the projects under test in this release are arranged in a logical order depending upon their interdependency. >>

Table 1: Test Plan

ID	Test	Status ¹	Date	Notes
	<<tests are given in Section 5 and later>>			

¹ Unwritten, Incomplete, Pass, Fail

3. Test Schedule (5%)

<< Specify the schedule for testing activities. >>

4. Traceability Matrix and Defect Tracking (10%)

4.1. Traceability Matrix

<< A list of requirements and their corresponding test cases >>

Table 2: Traceability Matrix

Req. ID	Test Case(s)

4.2. Defect Severity Definitions

Critical	The defect causes a catastrophic or severe error that results in major problems and the functionality is rendered unavailable to the user. A manual procedure is impossible to be implemented or high effort is required to remedy the defect. Examples of critical defects are as follows: • System abnormally terminates • Data cannot flow through a business function/lifecycle • Data is corrupted or cannot post to the database
Medium	The defect does not seriously impair system function can be categorized as a medium defect. A manual procedure requiring medium effort can be implemented to remedy the defect. Examples of medium defects are as follows: • Form navigation is incorrect • Field labels are not consistent with global terminology
Low	The defect is cosmetic or has little to no impact on system functionality. A manual procedure requiring low effort can be implemented to remedy the defect. Examples of low defects are as follows: • Repositioning of fields on screens • Text font on reports is incorrect

5. Test Cases (55%)

<< *The purpose of this section is to:*

- *guide the management and technical effort required during testing,*
- *establish test methods, anticipated outcomes, and user orientation,*
- *explain the nature and extent of each test,*
- *explain how the tests will evaluate system function or performance, and*
- *document test input, specific test procedures, and outcomes. >>*

<< Describe each test as shown below. >>

5.1. Test Case <N>

Objective: << Define the objective of Test <N>. >>

Notes: <<This area provides general notes concerning the test procedure. Such notes might include comments on how to execute the test procedure, an estimate of the test duration, the requirements of the procedure tests, or a statement of resources needed for this test.>>

Test No.: << Unique test ID >>		Current Status: << Passed / Failed / Pending >>		
Test title: <<This line contains the long title of the test procedure. This title should come from the test plan.>>				
Testing approach: <<Define the strategy that is being used on this test.>>				
STEP	OPERATOR ACTION	PURPOSE	EXEPECTED RESULTS	COMMENTS
N	Describe the actions taken by the person executing the test procedure. Include the test suite, or the name of the test file (in this case, the contents of the file could be given in the appendix).	Describe the reason for the step.	Describe the expected response of the system being tested to the action specified under OPERATOR ACTION. This should be derived from the SRS and SDD.	
Concluding Remarks: << Filled in by the person who completed the test >>				
Testing Team: << List members of testing team and lead >>		Date Completed:
